```
fragment. The protein can be used in place of a bone morphogenetic active fragment to create the fusion proteins of the invention. When a bone morphogenetic active fragment is used, the fusion proteins are designated bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic fusion protein as morphogenetic fusion protein as site, an EcM/bone binding site, a second proteinase site, and a bone morphogenetic fusion proteins can be used for enhancing wound the bone morphogenetic fusion proteins can be used for enhancing wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present sequence encodes a transforming growth factor beta active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

The present sequence encodes the mature form of transforming growth factor-beta-1. Dimeric, biologically active TGF-beta-like protein can be produced by subjecting the denatured monomeric form to refolding conditions. The new monomeric S-sulphonated TGF-beta-like protein is useful for the production of the dimeric, biologically active TGF-beta-like protein is useful for the treatment of wounds furface or internal) and cancer in a mammal, in bone and tissue repair, as a bone marrow protective agent, a mediator of cardioportection, for the production of an anti-inflammatory or immunosuppressive preparation. Treatment is useful for animals, especially humans, and wound treatment (e.g. ulcers, bed sores etc.) is tacattgacttccgacaggatctgggctggaagtgggtccatgaacctaagggctactat 120 240 241 caggacctggagcccctgaccatcctgtactatgttgggaggacccccaaagtggagcag 300 9 1 gotttggacaccaattactgcttccgcaacttggaggagaactgctgtgtgcgcccctc tacattgacttccgcaaggacctcggctggaagtggatccacgagcccaagggctaccat gecaacticigectegggeectgeectacattiggagectggaeacgeagtacageaag 181 gtcctggccctgtacaaccagcataacccgggcgcctcggcggcggcgtgctgcgtgccg gtgctgggactgtacaacactctgaaccctgaagcatctgcctcgccttgctgcgtgccc DB 20; Length 339; Indels Sequence 339 BP; 66 A; 114 C; 100 G; 59 T; 0 other; 60.4%; Score 204.6; DB 20; 75.2%; Pred.                                    encoding human pre-transforming growth factor-beta-1 (pre-TGF-beta-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 It was obtained by an analysis of several overlapping cDNAs and gene fragments, leading to the detn. of a continuous sequence corresp. to tl TGF-beta-1 precursor mRNA. It is useful in constructing vectors that encode biologically active transforming growth factor (TGF-beta), operably linked to DNA that encodes a secretory leader (SL). It, or a nucleic acid capable of hybridising with it, can also be labelled and used in diagnostic assays for DNA or mRNA encoding TGF-beta or related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid encoding transforming growth factor-beta -

Sequence encodes the 390 amino acid (AA) precursor transforming growth factor-beta 1 (pre-TGF-beta 1) polypeptide. The 5' untranslated region of the TGF-beta 1 mRNA is 841 bases long, is purine rich and has a region of potential secondary structure. The TATA-like sequence in the 3' untranslated region of the gene is presumably a polyadenylation signal. Mature TGF-beta 1 comprises the C-terminal 112 AA's of pre-TGF-beta 1 and is cleaved at the Arg-Arg dipeptide preceding its NH2 terminus. The nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleotide sequence encoding transforming growth factor beta-3 -used as a probe, or to produce TGF beta 3, for growth inhibition of certain normal and neoplastic cells, eg A549.

                                                                                                                                                                                                                                                                                                               cDNA sequences were determined for human pre-TGF-beta-1 (AAQ56923), pig TGF-beta-3 (AAQ56925) and human TGF-beta-3 (AAQ56926), and the corresponding amino acid sequences were determined (AAA46227-29, respectively). A genomic fragment corresponding to a human TGF-beta-1 exon (AAQ56924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the construction of vectors for the expression of recombinant TGF-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The cDNA encodes the pre-transforming growth factor (TGF) beta 1 protein. The nucleotide sequence was obtd. by an analysis of several overlapping cDNAs and gene fragments. The DNA is useful for the recombinant production of TGF beta 1, which can be used in, e.g. wound healing. (Revised entry submitted to correct sequence analysis breakdown.)

macrophage inducible nitric oxide synthase; iNOS; constitutive NOS; interleukin-1-beta; transforming growth factor-beta; TGF-beta; IL1-beta; nitric oxide production; hypotension; inflammation; septic shock;
         This nucleotide sequence codes for the human transforming growth factor-beta 1 precursor (preTGF-beta 1, see AAW78785). It is a composite of overlapping CDNA clones isolated from different cDNA libraries (placenta, A172 glioblastoma, HT1080 flbroblastoma) using TGF-beta exon (see AAV52936) restriction fragments as probes. The 3' region of the sequence was determined using cloned genomic TOR. The invention relates to the recombinant production of TGF-beta. Biologically active TGF-beta is defined as being capable of inducing EGF-potentiated anchorage independent growth of target cell lines and/or growth inhibition of neoplastic cell lines. Nucleic acids encoding TGF-beta have been isolated and cloned into evectors which are replicated in bacteria and expressed in cukaryotic cells. TGF-beta recovered from transformed cells is used in known therapeutic applications. TGF-beta nucleic acids are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gtectggccctgtacaaccagcataacccgggcgcctcggcggcgccgtgctgcgtgccg 1915

The cDNA encodes transforming growth factor-beta 1 (TGF-beta 1) which has been found to inhibit inducible nitric oxide synthase (1NOS) gene transcription, esp. in interleukin-1-beta (ILI-beta) stimulated rat smooth muscle cells, and at a dose which does not inhibit constitutive NOS. TGF-beta 1 or 2 (AAR83055) or their active fragments, can be used in the treatment of Appotension, such as that associated with severe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1679 gccctggacaccaactattgcttcagctccacggagaagaactgctgcggcggcagctg 1738

A chimeric gene (AAT16516) codes for a fusion protein (AAR89470) between the helical region of human collagen I(a) and human transforming growth factor beta-1 (TGF-beta-1). The collagen moiety was cloned from human fibroblast AG02261A cells by PCR amplification. The construct was inserted into a pMal vector for expression in E. coli. The fusion protein provides sustained release and delivery of TGF-beta-1 to a target tissue. The TGF increases efficacy of the body's normal soft tissue repair response and also induces

protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. The present sequence encodes a chimeric collagen I (alphal)/transforming growth factor-betal (TGF-betal) protein, which may be produced using the method of the invention.
                                                                                                                                                                                                                                                                                  Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; a hydroxproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation; ss. transforming growth factor-betal; TGF-betal; chimera; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method for producing an extracellular

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The TGFbetal mRNA was divided into 3 regions (i.e. 5'-UTR, CDS and 3'-UTR) for various "perturbation" experiments. The relative order of the 3 regions was altered, e.g. the 3'-UTR was positioned upstream of the CDS and the 5'-UTR was positioned downstream of the CDS. The experiments showed that interactions between coding and noncoding regions are destroyed by such perturbations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             121 gecaacttetgeteaggeeettgeeeataceteegeagtgeagacacaaceageaeg | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 111 | 11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TGF-betal is one example of a novel TGF-beta produced as a dimeric, biologically active protein using the method of the invention. This coding sequence was isolated from the CI-215 human glioma cell line. It was incorporated into an appropriate vector to transform Saccharomyces cerevisiae or E.coli. Monomeric TGF-betal was purified, denatured and dissolved in 140ml 50mM Tris/HCl pH8. IM NaCl. 5mM EDTA, After 72 hrs at 4 deg C, pH was adjusted to 2.5 and the mixture was conc. 10 times. The conc. soln was diluted to the original vol. with 10mM HCl and conc to a final vol of 10 ml. The supernatant from centrifigation at 5000g for 30 min contained disulphide-linked dimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240

AATI5462-T15464 encode transforming growth factor (TGF) beta-1,
TGF beta-2 and TGF beta-3 which are produced using recombinant
CTGF beta-2 and TGF beta-1ike proteins in
DNA technology and used to produce TGF beta-like proteins in
CTGT dimeric form. The TGF beta-1ike proteins produced are hybrids of
CTGT different types of TGF beta-1ike proteins of
CTGT beta morphogenic proteins e.g. BMP-2. The TGF beta hybrids were
made using a new process of producing dimeric, biologically active
TGF beta monomers with folding buffer contg. a mild detergent (CHAPS,
CTGF beta monomers with folding buffer contg. a mild detergent (CHAPS,
CTGF beta monomers with folding buffer contg. a mild detergent (CHAPS,
CTGF beta monomers with folding buffer contg. a mild detergent (CHAPS,
CTGF beta monomers with folding buffer contg. a mild detergent (CHAPS,
CTGF beta monomers with folding buffer contg. a mild detergent (CHAPS,
CTGF beta monomers with folding buffer contg. a mild detergent (CHAPS,
CTGF beta monomers with folding buffer contg. a mild detergent clamethylsulphone) and bmr (dimethyl formamide).
The detergent allows folding of the monomer such that, after
and remains in soluble form. The method allows relatively high yleids
of biologically active TGF beta-like proteins in their native dimeric
form. TGF-beta like proteins are multifunctional regulators of
cellular activity and a typical use is to stimulate wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tacattgacttccgacaggatctgggctggaagtgggtccatgaacctaagggctactat 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gtgctgggactgtacaacactctgaaccctgaagcatctgcctcgccttgctgcgtgccc 240

hTGF-betal; hTGF-beta2; hybrid protein; wound healing; cancer treatment; bone repair; growth regulation; ss. Transforming Growth Factor-betal(44/45)beta2 hybrid.

```
The invention covers hybrid TGF-beta molecules consisting of parts AQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-betal(44/45)beta2. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.
New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 336 BP; 90 A; 92 C; 72 G; 82 T; 0 other;

44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue. See e.g. AAQ41602-Q41607 for pref. hybrids.

                                                                                                                                                                                                                                                                                                                                                                                                                  g
```

The sequence given encodes a hybrid transforming growth factor (TGF) beta termed TGF-beta 1/Deta 2 (or TGF-5 Deta). The mutations indicated in the features table represent replacements of TGF-beta 1 bases with those from the corresponding positions of TGF-beta 2. Simian codon usage was maintained. This DNA sequence could be placed under the control of Simian virus 40 (SV40) expression regulatory region within an expression vector and used to transfect Chinese Hamster ovary (CHO) cells. CHO transfectants can be seen to synthesise and secrete high levels of mature TGF-5 beta. TGF-5 beta induces effects on the proliferation of vascular endothelial cells equivalent to those produced by TGF-beta 1. Length 1561; Sequence 1561 BP; 306 A; 541 C; 443 G; 271 T; 0 other; Score 195; DB 13; Pred. No. 3.7e-46; Disclosure; Fig 1; 45pp; English. 57.5%; 73.5%;

line. It was incorporated into an appropriate vector to transform Saccharomyces cerevisiae or E.coli. Monomeric TGF-betal was purified, denatured and dissolved in 140ml 50m Yris/HCl pH8. IM NaCl. 5mM EDTA, 2mM reduced glutathione, 1mm oxidised glutathione and 33mM Chaps. After 72 hrs at 4 deg C, pH was adjusted to 2.5 and the mixture was conc. 10 times. The conc. soln was diluted to the original vol. with 10mM HCl and conc to a final vol of 10 ml. The supernatant from centrifugation at 5000g for 30 min contained disulphide-linked dimeric
                                                                                                                                                                                           1335

AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue. See e.g. AAQ41602-Q41607 for pref. hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tacattgacttccgacaggatctgggctggaagtgggtccatgaacctaagggctactat 120

TGF-beta 2 (AAR92774) was cloned into plasmid pGEM-5ZF(+) (Promega) and the construct used to transform E. coli Y1090. Subcloning in ppLMu yielded plasmid ppLMu.hTGF-beta 2. Non-soluble, monomeric TGF-beta 2 was recovered from E. coli LC 137/ppLMu.hTGF-beta 2 (DSM 5657) transformants. A biologically active, dimeric form of TGF-beta 2 was obtd. by refolding this monomer in detergent-free buffer contg. DMSO and/or DMF. Dianers of TGF-beta 1 (AAR92773) and TGF-beta 3 (AAR92772), and hybrid dimers (see also AAR92775-77), were
                                                                                                                                                                                                                                                                                                                                                               tacattgatttcaagagggatctagggtggaaatggatacacgaacccaaagggtacaat 120

A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. The present sequence encodes a specifically claimed TGF active fragment. The present sequence encodes a specifically claimed TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding anothe protein sequence may contain some or all of the following elements: purification tag:proteinase site:ECM binding site-proteinase site:TGF-beta. TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gigetigggactgiacaacactetgaaceetgaageatetgeetegeettgetgegggege 240

Dimeric, biologically active TGF-beta-like protein can be produced by subjecting the denatured monomeric form to refolding conditions. The new monomeric S-sulphonated TGF-beta-like protein is useful for the production of the dimeric, biologically active TGF-beta-like protein, which is useful for the treatment of wounds (surface or internal) and cancer in a mammal, in bone and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       repair, as a bone marrow protective agent, a mediator of
cardioprotection, for the production of an anti-inflammatory or
immunosuppressive preparation. Treatment is useful for animals,
especially humans, and wound treatment (e.g. ulcers, bed sores etc.) is

The present sequence encodes a transforming growth factor beta active fragment. The protein can be used in place of a bone morphogenetic active fragment to create the fusion proteins of the invention. When a bone morphogenetic active fragment is used, the fusion proteins are designated bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic purification may contain some or all of the following elements: a purification tag, a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The bone morphogenetic fusion proteins can be used for enhancing wound

The cDNA encodes transforming growth factor-beta 2 (TGF-beta 2) which has been found to inhibit inducible nitric oxide synthase (INOS) gene transcription, esp. in interleukin-1-beta (ILI-beta) stimulated rat smooth muscle cells, and at a dose which does not inhibit constitutive NOS. TGF-beta I or 2 (AAR83055) or their active fragments, can be used in the treatment of hypotension, such as that associated with severe inflammation or septic shock.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TGF-Beta2 may be used in treatment of tumors at effective doses, and may also be useful in augmenting wound healing by stimulating cell proliferation. The growth factor can be produced at high levels from a CHO expression system.

The produced TGF-beta2 protein be used to regulate cellular differentiation and proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hybrid transforming growth factor beta-1/TGF-beta-2 precursor -
to produce biologically active, mature TGF-beta-2

```
The invention covers hybrid TGF-beta molecules consisting of parts nof the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta2(44/45)beta1. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc.
                                                                                                                                                                                                                                                                                                         /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TGF-Beta2 may be used in treatment of tumors at effective doses, and may also be useful in augmenting wound healing by stimulating cell proliferation. The growth factor can be produced at high levels from a CHO expression system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cloning and expression of transforming growth factor beta 2 - used for treatment of tumors or for augmenting wound healing.

                                                                                                                                                                                                                                                                                                                                                                                   This hybrid DNA sequence is expressed in a host cell, preferably a COS or CHO cell, containing a recombinant vector encoding this sequence under the control of a 2nd nucleotide sequence that regulates gene expression, preferably the SV4O promoter, so the host cell produces active TGF-beta2. The produced TGF-beta2 protein can be used to regulate cellular differentiation and proliferation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence given encodes the human transforming growth factor (TGF)-beta 1. This was used within the scope of the invention to compare to a similar TGF hybrid termed TGF-beta 1/Deta 2 (or TGF-5 beta) (see also AAQ29177). The chimeric DNA sequence could be placed under the control of Simian virus 40 (SV40) expression regulatory region within an expression vector and used to transfect Chinese Hamster ovary (CHO) cells. CHO transfectants can be seen to synthesise and secrete high levels of mature TGF-5 beta induces effects on the proliferation of vascular endothelial cells equivalent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1220 gccaacttctgcctcgggccctgccctacatttggagcctggacacgcagtacagcaag 1279

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence encodes a pancreatic ductal trophic factor (PDTF) polypeptide. The polypeptide is expressed by e14.5 pancreatic mesenchymecells (especially members of the TGF-beta (transforming growth factor-beta) super family), and is capable of stimulating growth and differentiation of pancreatic tissue. The polypeptides may be used for inducing outgrowths of pancreatic duct tissue, e.g. for treating

ö
         This sequence encodes an exon of transforming growth factor-beta 1 (TGF-beta 1) polypeptide corresponding to AA's 288-338 of mature TGF-beta 1. The nucleic acid sequence encoding the second subtype of TGF-beta (TGF-beta 3) is useful as a probe or to produce TGF-beta 3 for both normal and neoplastic cell growth inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant human transforming growth factor-beta prods. - produced using Chinese hamster ovary cells, for use in diagnostic applications

The transforming growth factor (TGF) beta 1 exon was identified using the "long probe" strategy used previously for TGF-alpha. Long oligonucleotides (T1572-23) designed on the basis of the partial protein sequence were used as hybridisation probes for the exon in a human genomic DNA library. The TGF beta 1 exon was then used as a probe for the isolation of TGF beta 1 cDNA (see AAT15270). DNA encoding TGF beta 1 is useful for the recombinant production of the protein, which is useful in, e.g. wound healing.

                                                                                                                                                                                                                                                                                                                                                 transforming growth factor-beta 1 (TGF-beta 1) gene incorporating an exon and flanking intron sequences. It was isolated from a human genomic library using probes based on a partial protein sequence of TGH-beta 1. The exon encodes amino acids 288-338 (see AAW78788) of TGF-beta 1. Restriction fragments of the isolated exon were used as probes for the isolation of TGF-beta 1 cDNAs (see AAV52933). The invention relates to the recombinant production of TGF-beta. Nucleic acids encoding TGF-beta have been isolated and cloned into vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from transformed cells is used in known therapeutic applications. TGF-beta nucleic acids are also useful in diagnosis and identification of TGF-beta
                                                                                                                                                                                                                                                                                           21 cttccgcaacttggaggagaactgctgtgtgcgcccctctacattgacttccgacagga 80
useful for analysis to perform manipulations to increase yield of recombinant production of the protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      401 ceteggetggaagtggatecaegageecaagggetaecatgecaaettetgeetegggee 460
                                                                                                                                                                                                                                                            cDNA sequences were determined for human pre-TGF-beta-1 (AAQ56923), pig TGF-beta-3 (AAQ56925) and the corresponding amino acid sequences were determined (AAR46227-29, respectively). A genomic fragment corresponding to a human TGF-beta-1 exon (AAQ56924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the construction of vectors for the expression of recombinant TGF-

                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                This synthetic gene was designed based on reported sequence data, codons inferred from known amino acid sequences and observations of partial homology with known genes of the TGF-beta family. It was assembled from chemically synthesized oligonucleotides and can be expressed in prokaryotic host cells. The sequence is that given in the specification, however, 50 bases should be inserted between nucleotides 600 and 601 of this sequence: the two "missing" Cys codons are presumably contained in the omitted sequence. The truncated TGF-beta protein is cleaved from the Fb-Fb domain at the hinge region to give the truncated product.

```

```
This sequence was isolated from positive clones in a bovine lambda gt10 library isolated with probes AAQ23673-6, which were then screened with HEL5. One which hybridised positive was sequenced to yield the given sequence. An inframe stop codon indicates it encodes the C-terminal part of bovine BMP-6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     67 gacttccgacaggatctgggctggaagtgggtccatgaacctaagggctactatgccaac 126

The probes were based on the tryptic peptide fragment from bovine bone morphogenic protein (BMP-6) having the sequence XHELVSFS. A further clone representing the carboxy terminal part of the bovine BMP-5 cartilage/bone protein (see also AAQ37566) was isolated under more stringent conditions.

The invention is related to purified bone morphogenic proteins (BMP). Compositions comprising a matrix, a vehicle and a purified dimeric BMP-5 or naturally occurring allelic sequences of BMP-5 are used for inducting bone/and or cartilage or other connective tissue formation in a patient and is useful in wound healing e.g. ulcers, burns and incisions, tissue repair and treating periodortal disease. The composition can be used to treat cell populations e.g. embryonic cells, stem cells to enhance or enrich growth and/or cell differentiation. Tissues that can be treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bone morphogenic protein; BMP-5; bone formation; cartilage; ulcer; connective tissue; wound healing; burn; incision; tissue repair; BMP-6; periodontal disease; cell differentiation; osteoarthritis; osteoporosis; bone fracture; cosmetic plastic surgery; neuronal survival; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               morphogenic protein composition useful in wound healing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     carboxy-terminal part of bovine BMP-6 bone protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "BMP-6 carboxy terminal fragment"
Example 4; Columns 19-20; 20pp; English.

5
include epidermis, nerve, muscle, liver, lung, cardiac, pancreas and kidney. Osteoarthritis and osteoporosis can also be treated. It is useful for healing bone fractures and cartilage defects in humans and other animals, particularly domestic animals and thoroughbred horses and also has uses in cosmetic plastic surgery. The composition may increase neuronal survival and be useful in transplantation and the treatment of conditions which exhibit a decrease in neuronal survival. The present sequence represents a DNA encoding the carboxy-terminal part of bovine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     - useful
